

Nutrabay PDP Research & PRD

Pre-Purchase Journey — Product Detail Page Audit

1. Context & Method

As part of preparing for the Product Intern role at Nutrabay, I audited the live Product Detail Page (PDP) for Nutrabay Pure Whey Protein Concentrate (nutrabay.com/product/nutrabay-whey-protein-concentrate) — one of the site's bestselling SKUs — to identify real friction in the pre-purchase journey. This is genuine, current-state research on Nutrabay's own live site, not a hypothetical exercise.

2. Issues Found

Issue #1 — Price shows ₹NaN in the Price Details drawer

The PDPs expandable "Price Details" panel is supposed to show MRP and Selling Price. On the page it shows "₹NaN", for both fields. This is a state that every visitor sees when they open that panel. Directly hurting trust at the exact moment a customer is deciding to buy.

Issue #2 — Rating breakdown shows NaN% per star

The Ratings and Reviews section shows how many people gave one star, two stars, three stars, four stars and five stars. It is supposed to show the percentage of people who gave each number of stars.. Right now it just says "NaN" for each one like "5NaN%" instead of a real percentage. The Ratings and Reviews section does show how stars each thing got and the total average of 4.7 stars is correct. The problem is with the percentages for each number of stars. This makes me think it is a problem with how the numbers are shown, not a big problem with the numbers themselves. The star counts and the overall average of 4.7 stars for the Ratings and Reviews section are correct; only the percentage, for each star count, is wrong. It is probably a simple fix.

Issue #3 — Redundant variant-selection step for single-option products

This product only comes in one flavor, which's Unflavoured.. When you look at the product details you still see a dropdown menu that says Select Flavour. You have to click on this menu before you can add the product to your cart. This is a step that you do not really need to do. It is a thing but it can be annoying when you have a lot of products that only come in one flavor. The product details page should not have this menu for products, like this. It would be better if you could just add the product to your cart without having to click on the Select Flavour menu. This would make it easier to buy products that only come in one flavor like this one.

Issue #4 — Price shown as a range before a variant is selected

When you are about to choose a weight for the product like one kilogram or two kilograms you will see the price range at the top of the page. This price range is something like ₹3,279 to ₹6,499. It is right next to the title of the product. If you are visiting the page for the time and you are looking at it quickly you might see the lower price first. You might think this lower price is for the product you want. Then you will realize it is actually, for the smaller pack of the product.

3. Prioritization (RICE)

Scored using $\text{Reach} \times \text{Impact} \times \text{Confidence} \div \text{Effort}$ (each on a 1–10 scale, Effort as a divisor) — the same framework used in my independent Zomato case study, applied here to a live product.

#1 Price shows ₹NaN in Price Details drawer	9	9	10	2	40.5
#2 Rating breakdown shows NaN% per star	7	6	10	2	21.0
#3 Redundant "Select Flavour" step for	8	4	8	3	8.5

single-option products					
#4 Price range shown before variant selected	8	5	7	4	7.0

Issue number 1 (the price bug) has the score by a lot. It affects every visitor who looks at pricing details. That means it has a reach. It also directly impacts whether people trust the purchase process. That means it has an impact. It is easy to check. That means it has confidence. You can reproduce it on the live page right now.. It is probably a small formatting or null-handling fix. That means it has effort. This issue is the priority.

4. Recommended Fix — Issue #1

Wireframe spec for the corrected Price Details drawer (see accompanying Figma link):

- Replace ₹NaN with the computed MRP and Selling Price values, taken from the same price field that is already showing correctly at the top of the page.
- Add a fallback state (like hiding the row or showing "Price updating...") if the value is ever really not available. A null value never appears to the customer as "NaN" again.
- Add an automated test that makes sure Price Details always shows a currency value. Prevents Regression.

5. Success Metrics

- Price Details panel shows a ₹ value on all page loads (currently not working).
- There is no change (or a small increase) in the Add-to-Cart rate from sessions that open the Price Details panel. This shows the fix takes away problems of causing new ones.
- No customer-support tickets mention "NaN" or "wrong price" on this product page, after the fix.
